

THE CASEBOOK OF DETECTIVE WHISPER

*Two small games about a big discovery. Every probability in this booklet was **measured on a real quantum computer** in July 2026 — none of the odds were designed.*

[plain-text \(.md\)](#)

Game 1 — THE INTERROGATION

2+ players · two ten-sided dice (d100) · 10 min

The city's machines come in pairs: **PARTNERS** (their stories agree no matter who is questioned first) or **RIVALS** (their stories come out opposite). You may question each suspect **once**. Then you must call it.

1. One player is the **Dealer** (holds the Case Table, page 2). Others are Detectives.
2. Dealer rolls d20 (or picks secretly) to select a **Case** and announces only the two suspect names.
3. The Detective chooses an **Interrogation Kit** (cut-out cards, page 2) and announces it.
4. Dealer rolls d100 against that case's column for that kit. Roll $\leq$ number = the kit points to the **correct** answer this round; the Dealer says "your kit says PARTNERS" (or RIVALS) accordingly — truthfully on a success, falsely on a failure.
5. The Detective calls PARTNERS or RIVALS (you may distrust your kit!). Dealer reveals. Correct = 1 point. Play 10 rounds; track your % on the score track.

THE CEILING: no kit that questions each suspect once — not these two, not any kit anyone will ever invent — can average above 91%. That is a mathematical theorem.

Then earn the **SWITCH BADGE** (after 10 rounds): re-play using the SWITCH column — the odds a real quantum computer achieved by questioning the suspects **in both orders at once**. Welcome to the forbidden zone.

Game 2 — STATIC

2+ players, co-op · two ten-sided dice · 10 min

The Sender seals a secret — **RED or BLUE** — and must whisper it through **two censor machines** that each turn everything to static. Mathematics proves: in any order, with any tricks, **zero** information survives. The precinct listens anyway.

ROUND (CLASSICAL MODE)

1. Roll d100 on the CLASSICAL table (page 3). Yes, it's 50/50 no matter what. Feel free to arrange the censors differently first. It will not help. It cannot help.

ROUND (SWITCH MODE)

1. Roll the **STAMP** die (d100): 01-62 the stamp is **UP**, else **DOWN**.
2. Roll the **MESSAGE** die (d100) on the matching row of the Switch Table.
3. Decode rule: stamp UP → guess what the message die says. Stamp DOWN → guess the **opposite**.
4. Tally the round's guess. After 15 rounds, the precinct's answer is the **majority**.

One round is a whisper (~62%). Fifteen rounds is a voice (~83%). Twenty-five is a verdict (~89%). **The signal compounds. The coin never does.**

□ **What's really true:** the classical 50/50 is not a rule of this game — it is a theorem about the world, and our control experiment measured it: 0.00012 bits. The switch column replays real measured data. See THE TRUTH (page 4).

Game 1 — Dealer's Case Table *(Dealer's eyes only)*

Roll $\leq$ number on d100 = kit points to the CORRECT answer. 00 counts as 100.

d20	The suspects	ROOKIE kit	CASEFILE kit	$\leq$ SWITCH	truth
1	The Mirror & The Mirror	100	100	99	PARTNERS
2	The Twist & The Twist	100	100	99	PARTNERS
3	The Judge & The Judge	100	100	99	PARTNERS
4	Blend East & Blend East	50	100	99	PARTNERS
5	Blend Dawn & Blend Dawn	100	100	98	PARTNERS
6	The Nobody & The Mirror	100	00	98	PARTNERS
7	The Nobody & The Twist	00	00	98	PARTNERS
8	The Nobody & The Judge	00	00	98	PARTNERS
9	Blend South & The Nobody	50	00	97	PARTNERS
10	Blend Dusk & The Nobody	00	00	97	PARTNERS
11	The Mirror & The Twist	100	100	97	RIVALS
12	The Mirror & The Judge	100	100	97	RIVALS
13	The Twist & The Judge	00	100	97	RIVALS
14	Blend East & Blend West	50	100	98	RIVALS
15	Blend North & Blend South	50	100	97	RIVALS
16	Blend Dawn & Blend Dusk	00	100	97	RIVALS
17	The Judge & Blend East	50	100	98	RIVALS
18	The Mirror & Blend Dusk	100	100	97	RIVALS
19	The Twist & Blend North	50	100	97	RIVALS
20	Blend West & The Judge	50	100	98	RIVALS

Notice the Casefile kit — the best straight-reading kit we know — is **always wrong** when The Nobody is involved. That blind spot is real physics: the "do-nothing" suspect is exactly what breaks the cleverest classical strategy. (And notice the SWITCH column simply doesn't care.)

INTERROGATION KITS — CUT OUT ∞

ROOKIE KIT

Interview each suspect separately with the same standard question.
Straight-dealing, simple, and confidently wrong about The Twist.
deck average: 57.5%

ENTANGLED CASEFILE

One case-file in two linked halves; each suspect stamps their half once, then compare.
The best kit any detective can carry. Beware The Nobody.
deck average: 75% ·
theoretical best of ALL kits: 91%

✂ SWITCH BADGE

Question both suspects **in both orders at once**. Not a trick of scheduling — a physically different kind of question.
measured average: 97.8% ·
ibm_marrakesh · replicated on ibm_fez (97.4%)

SCORE TRACK (MARK 1 BOX PER CORRECT CALL; RED LINE = THE CEILING)

10	20	30	40	50	60	70	80	90	91+ forbidden
----	----	----	----	----	----	----	----	----	---------------

THE CEILING – 91% – proven (Araújo et al. 2015; bound re-derived and machine-checked by this project).
No definite order of questioning can cross it.

zone

Game 2 — STATIC: the tables

CLASSICAL MODE (ANY CENSOR ORDER, ANY TRICK)

d100	the static says...
01–50	RED
51–00	BLUE

...regardless of the secret. Forever. (Measured: 0.00012 bits.)

SWITCH MODE

step	roll	result
STAMP	01–62	UP
	63–00	DOWN
MESSAGE if UP	01–60	die shows the TRUE color
	61–00	die shows the false color
MESSAGE if DOWN	01–66	die shows the FALSE color
	67–00	die shows the true color

Decode: UP → trust the die. DOWN → flip it.
(Dealer knows the secret and reads the die accordingly; detectives only ever hear the die's color and the stamp.)

PRECINCT TALLY — 15 ROUNDS

rd	stamp	die says	guess
1			
2			
3			
4			
5			
6			
7			
8			
9			
10			
11			
12			
13			
14			
15			

Majority of guesses = the precinct's verdict.
Expected: 5 rounds → 72% · 9 → 77% · 15 → 83% · 25 → 89%

□ **Why the stamp?** The message alone is perfect static — measured. The stamp alone is perfect static — measured. The secret lives only in how they *move together*. Two useless things, one whisper. That correlation is what the quantum switch bought, and it is worth exactly 0.0436 bits per round.

□ THE TRUTH — what these games replay

In July 2026, an autonomous AI research network ran pre-registered experiments on IBM's 156-qubit quantum processors. In a **quantum switch**, the *order* of two operations is put into genuine superposition — not unknown, not random: *neither-and-both*.

Game 1 replays the causal discrimination game (finding F82): deciding whether two operations commute ("Partners") or anticommute ("Rivals") with one use of each. The proven ceiling for any definite-order strategy in the balanced game is **0.9098**; the switch scored **0.9769 ± 0.0005** on `ibm_marrakesh` (job `d9826lkqp3as739sd2lg`, 216.8σ) and **0.9738** on `ibm_fez` — a chip it had never touched — the next day.

Game 2 replays capacity activation (finding F83): two channels that each destroy all information — and provably destroy it in ANY definite order — transmitted **0.0436 bits per use** when combined in the switch (job `d983ek52su3c739ip92g`, 55.6σ). The message alone: static. The stamp alone: static. Together: a whisper. The control experiment (definite order, same machines, same day) measured 0.00012 bits — the coin flip your classical table prints.

What the dice can and cannot claim: dice can replay any numbers, so the games prove nothing by themselves — the theorem does: no arrangement of the real machines in any definite order could have produced the SWITCH columns. The quantum computer did. Every threshold in this booklet is the measured number, rounded to a d100.

Everything is public and auditable — pre-registrations frozen before data, job IDs, analysis code, and an interactive demo:
